

Subnets

14 November 2024

20:15

A subnet mask is used to divide the IP address into the network & host portions.

- ① IP Address
- ② Subnet (Subdivision of IP address)
- ③ Subnet Mask (Defines the different portions of network & host in IP Add.)
- ④ CIDR - Classless Inter-Domain Routing (method of allocating IP addresses)
- ⑤ Default Gateway (Router / device that connects local network to external network)
- ⑥ Network Address (First address of subnet)
- ⑦ Broadcast Address (Last address)
- ⑧ Host Address (within a subnet, assigned to individual devices)
- ⑨ VLAN (groups devices from different physical LANs)
- ⑩ Supernetting (combining multiple smaller subnets)
- ⑪ DHCP - Dynamic Host Configuration Protocol (protocol that assigns IP)
- ⑫ NAT - Network Address Translation (Private IP $\rightarrow$ Public IP)

★ Classful Addressing

Older method of dividing IP address space into fixed classes, each with a specific range & size.

- Class A
- Class B
- Class C
- Class D (Multicast)
- Class E (Experimental)
